Model ACL 34230

Prevent costly particle buildup
Activates up to 15 ft diameter of material • Cleaning distance up to 30 ft

Reduce plant shutdowns • Improve material flow

AcoustiClean® Sonic Horns are designed to produce high-energy, low-frequency sound vibrations to disperse and prevent costly buildup of material in hoppers, bins, silos, boilers, ESPs, SCRs, fans and more.

Sound waves are produced by applying compressed air to the sound generator, vibrating a high-strength titanium diaphragm. A typical pulse length is 10 seconds with each pulse using approximately 10 cfm of compressed air.

Model ACL 34230 is a two-section horn ideal for use on bins and silos to break ratholing and plugging, as well as on boilers to keep tubes clean. The effective cleaning distance is up to 30 feet in front of the horn and 15 feet in diameter.

• Easy to install – mount outside vessel or hang inside
• Improve process efficiency and productivity – fewer unscheduled shut downs for cleaning.
• Low maintenance – titanium diaphragm is the only moving part.
• Low operating cost
• Cast iron or stainless steel construction

AcoustiClean® Sonic Horn Applications

Boilers – Cleans heat transfer surfaces to increase heat transfer efficiency and eliminate the need for soot blowers.

Baghouses – Helps reduce pressure drop across surfaces, extending bag life.

Fans – Eliminates material build-up on blades.

Electrostatic Precipitators (ESP) – Eliminates rapping system and wear to plates and wires.

Silos, Bins, Hoppers – Eliminates ratholing, bridging and prevents particulate buildup on vertical walls.

Selective Catalytic Reduction (SCR) – Cleans catalysts.

Recommendations for successful AcoustiClean® sonic horn installation:

Vessel must be clean and free of deposits for facilitating optimal material flow.

The material must be relatively dry and powdery. Sonic horns are typically not effective if the moisture content is above 25%.

Compressed air pressure and volume must be maintained at 70-90 psi / 40-80 cfm to ensure horns are able to emit sound efficiently.

On boilers, the most effective installation will have the horn(s) blowing in the same direction as the pipes, where the acoustics can get between the pipes and the walls of the boiler. (For example, end-to-end.) Sounding the horn behind pipes on one side of the boiler toward pipes on the other side will generally not produce effective results.
Typical AcoustiClean Sonic Horn System Components

**Sonic Horn – Specify model number**

**Titanium Diaphragm**
The only moving part in an AcoustiClean® sonic horn is the titanium diaphragm, which should be replaced annually.

**Stainless Steel Flex Hose**
Connects the solenoid valve and hard piping from your compressor.

**Timers**
Two options are available to control the interval and length of time the AcoustiClean® horn will sound.
- Timer/sequence controller designed to control multiple sonic horns.
- Timer plugs into the DIN contacts on the valve to control one horn.

**Solenoid Valve**
Controls the flow of air to the horn.

**1" High-flow Particulate Filter**
Enhances life of system components by removal of in-line contaminants.

**1" High-flow Regulator**
Necessary for regulating compressed air supply to within 70-90 psi for proper horn operation.

**1" Locking Ball Valve**
Ideal for isolating the horn when system maintenance is required.
